SL English  
AB Human neural-crest-derived tumor cell lines, including three  
neuroblastomas, an astrocytoma, a glioblastoma, a rhabdomyosarcoma and a  
melanoma were screened for the expression of the integrin alpha sub(4)  
beta sub(1) (**VLA-4**). The neuroblastomas IMR-32 and  
SK-N-SH, the astrocytoma 131-IN1, the glioblastoma Fogerty and the  
rhabdomyosarcoma TE-671 expressed alpha sub(4) beta sub(1) as  
determined by cytofluorometry and immunoprecipitation. Another  
neuroblastoma line, LA-N-1, did not express alpha sub(4) beta sub(1).  
Analysis of immunoprecipitated alpha sub(4) beta sub(1) showed that  
the  
**alpha sub(4) subunit** from the  
various cell types differed in relative molecular weight ( $M_{sub(r)}$ ). The  
variability in the observed  $M_{sub(r)}$  could be accounted for by  
differences  
in the levels of N-linked glycosylation. The observed variability in  $M_{sub(r)}$   
did not appear to affect function since intact cells and  
solubilized alpha sub(4) beta sub(1) bound to a synthetic peptide  
identical in sequence to the CS-1 region of the alternatively spliced  
IIIICS domain of **fibronectin**, a known alpha sub(4) beta sub(1)  
ligand.

CC 15-8 (Immunochemistry)  
AB Leukocyte adhesion to the endothelial venules in the pancreatic islets is thought to be one of the initial steps in the development of insulin-dependent diabetes mellitus. It has been suggested that leukocyte adhesion to endothelium is a sequential multistep process involving various different homing receptors. The authors report here that blocking different homing receptors, namely, L-selectin and very late antigen 4 (**VLA-4**), which function during different stages of the adhesion process, by specific monoclonal antibodies inhibits insulitis and prevents diabetes in mice. Moreover, leukocyte attachment to the inflamed vessels within pancreatic sections could be inhibited by anti-L-selectin and anti-**VLA-4** antibodies. Interestingly, anti-L-selectin or anti-**VLA-4** antibody did not appear to influence the autoimmune response to a panel of pancreatic .beta.-cell autoantigens. These data suggest that L-selectin and **VLA-4** receptors are involved in mediating leukocyte homing to the islets and that intervention of these two adhesion pathways may provide a novel approach for **treatment** of autoimmune diseases such as **insulin-dependent diabetes mellitus**.

DT Journal; General Review  
LA English  
AB A review with 132 refs. Insulin-deficient **diabetes** can be  
**induced** in animals by administration of a no. of **chems.**,  
principally alloxan and **streptozotocin**. Alloxan and  
**streptozotocin** act at several sites in the B-cell, including the  
cell surface (glucose transporters) and intracellularly (free radical  
formation and DNA damage). Spontaneous diabetes occurs in the BB rat and  
the NOD mouse, which are the best models of human type I diabetes. The BB  
rat is characterized by a genetic predisposition to diabetes that develops  
after a long prediabetic period and is autoimmune in nature.  
Environmental factors, such as viruses and diet, have an influence on the  
development of diabetes in both animal models and man. The roles of  
tolerance induction, immunomodulation, .beta.-cell death and repair  
mechanisms, in respect of their effects on diabetes outcome, were the  
subject of considerable interest and have led to the initiation of a no.  
of clin. trials.
